

A 10-MINUTE PRIMER

FINANCE+OKEN

94% of the world's population do have access to essential health services.

It turns out, however, that would be a highly over-optimistic misread of what WHO and the World Bank found. By more reasonable understandings of how many people lack access to essential health services, untold hundreds of millions more than 400 million people lack access to essential health services 🤖

The road ahead to universal health coverage is longer than the headline figure implies.

As a preliminary matter, it should be noted that the essential health services selected are all for health care, not addressing such underlying determinants of

health and public health measures as access to clean water and sanitation and comprehensive tobacco control measures.

In 2012, nearly 750 million people lacked access to improved drinking water sources, while far more still, 2.5 billion people, did not have access to improved sanitation facilities.

The WHO/World Bank report, Tracking Universal Health Coverage: First Global Monitoring Report, states: “at least 400 million people currently lacking access to one of seven essential services for Millennium Development Goal (MDG) priority areas”

The health services monitored are not all essential health services, nor do they span a wide range of illness and injury. Rather, they are these: “The total estimate of 400 million includes all women whose demand for family planning is not met, pregnant women who did not make at least 4 antenatal visits..., infants who did not receive 3 doses of DTP-containing vaccine, HIV-positive adults and children not receiving HIV treatment, adults with new cases of TB not receiving TB treatment and children 1–14 years not sleeping under an insecticide-treated bed net (ITN))”

These health services are, indeed, all essential, all quite worthy of inclusion. Yet surely health services for non-communicable diseases, including mental health care, and injuries are “essential” too. One frequently proposed measure regarding non-communicable diseases is access to medicine to control hypertension.

Primary health care services need you herds for a scalable and conservative solution to maintain a balance between health and wealth.

WHAT IS FINANCE TOKEN?

Finance Token is a community driven crowd funding platform to facilitate crowd funding on the BNB blockchain. it aims at keeping a fair ratio between good health and wealth by generating donations through gas fee and community participation.

To achieve this Finance Token is building a yield farming platform that interacts through staking secured by the Binance blockchain.

WHO IS FINANCE TOKEN FOR?

Developers

who want to build applications that cenote's good health and wealth amongst all improving the Finance token ecosystem and aims?

Users

who want to help keep an equal balance between health and wealth through Buying, holding, and transacting with the Finance Tokens?

Charitable NGOs

such as international red cross and red crescent movement NGOs and Charitable organizations will receive donations ensured by the usage of finance token.

HOW DOES FINANCE TOKEN WORK?

Meet Alice

Alice is a Delegator. She is holding and using Finance Token for day-to-day transactions on the web3 defi platforms.

Meet Bob

Bob is living with aids: he is receiving free health care through an orchestrator, a local hospital in Serbia, this is ensured by Alice who holds and uses Finance Token.

When Bob goes to the hospital 'with little or no cash, he receives free health care through this registered Orchestrator. fees paid with the Finance Token network. Courtesy to Delegators like Alice who are users holding and staking Finance Token.

Today is an important day for Bob. he has his final checkup! How can Alice be sure that Bob will get the best of treatment he deserves?

There are two key actors in the Finance Token network that ensure an equal Balance between health and wealth. Orchestrators and Delegators.

First, let us go over the role of Orchestrators.

ORCHESTRATORS

In Finance Token, any NGO and Charitable organization can join the network and become what is known as an orchestrator by Signing Agreements to mandates you to offer free and immediate healthcare services to consumers in your Region. either subsidized or 100% free. contribute your PILLS to help Citizens like Bob.

For doing so, you earn fees in the form of a cryptocurrency like BNB, or a stable coin pegged to the US dollar like BUSD.

Sounds good, right? But wait, there is a catch! To earn the right to do this type of work on the network, you must first earn or acquire Finance Token also known as FIN. either through a whitelisting spot or our public Presale.

FINANCE TOKEN

The purpose of the Finance Token (FIN) is to chain secured crowd funding and donations through staking and segmented gas fees. In the FIN ecosystem, owning FIN is required to become a delegator or orchestrator. The more FIN you own, stake and the more transactions you can perform on the network you earn BUSD rewards. As the network's usage grows, so does the demand for orchestrators and thus FIN.

Of course, not everyone has the resources required to perform the job of an orchestrator since you must show ownership or notable affiliation with a health care center or NGO. do not be sad you can be a delegator just like Alice.

There is another set of actors in the FIN Network who play a less active but equally key role within the ecosystem — Finance Token Delegators.

DELEGATORS

Delegators are Finance Token holders who participate in the network by staking their tokens towards orchestrators who they believe are doing good and honest work. You can think about staking like putting a deposit down. When you stake, your tokens become locked up for a period and then you can take them back or trade in DEX and share with others on the network. Doing this helps ensure that the network is more profitable, safe, and transparent.

You may be wondering, why would a token holder stake their tokens? What is in it for them?

REWARDING PARTICIPATION

When a transaction pays fees into the network, all orchestrators, delegators, and developers earn a portion of those fees as a reward for ensuring a high-quality, safe, and secure network.

In addition to earning fees, Finance Token mints new token over time, like Bitcoin and Ethereum block rewards, which are split amongst all delegators, developers, and orchestrators in proportion to their total stake relative to others in the network.

This has the effect of growing network ownership amongst those who participate and shrinking it amongst those who do not.

It also gives orchestrators a powerful economic advantage over traditional centralized health system since the value of the token offsets what they need to charge beneficiaries to break even. With traditional health care system, they must charge you their cost of service for providing conservative health care overtime.

Neat right? Next, let us go over how often new tokens are minted.

ROUNDS & INFLATION

Rounds

In Finance Token, new tokens are minted every so-called round. Rounds are measured in Ethereum blocks, where one round is equal to **5760** Ethereum blocks. In Ethereum, one block is mined on average every **15.38** seconds, which means one Finance Token round lasts roughly **24.61** hours. Assuming the Orchestrator you are staked to is doing its job, this is how often you can expect to receive reward tokens.

Next, let us go over the Finance Token inflation rate, or in other words, the way by which the Finance Token protocol determines how many new tokens to mint each round.

Inflation

The current rate of inflation as of today's round is **0.02185%** and there are currently a total of **10 000 000 000** Finance Tokens have been created. So, if you do the math, a total of **5,444.7** newly minted Finance Tokens will be rewarded to all participants during the next round.

The cool thing about Finance Token is the inflation rate adjusts automatically depending on how many tokens are staked out of the total circulating supply. Currently, the total supply of Finance Token stands at **10 000 000 000** and of those, **5,559,303,000.81** are staked. Finance Token refers to this ratio (**50.4%**) as its 'participation rate'.

Finance Token presupposes that a target rate of **50%** is a healthy trade-off between network security and token liquidity, so to hit this target, the protocol incentivizes participation by increasing the inflation rate by **0.00005%** for every round the participation rate is below **50%** and decreasing it **0.00005%** for every round the participation rate is above **50%**.

FINANCE TOKEN IS GROWING!

Today, there are **0** delegators securing the network, with more and more participants joining the network every day.
